PROFESSIONAL EXPERIENCE

AI Engineer Intern — Nexwift

March 2025– june 2025

- Contributed to multiple AI-driven projects during a 3-month internship and 1-month employment period, focusing on prompt engineering and model output optimization for production-level AI systems.
 - Developed and fine-tuned prompts for LLM-based applications, improving response accuracy and contextual consistency.
 - Collaborated with a full-stack team using JavaScript (NestJS) to integrate AI functionalities into web services and automate backend processes.
 - Assisted in deploying and testing AI endpoints for internal tools and external client applications.
-

PROJECTS

Virtual Dressing Room — University Project

Flutter, Django, PyTorch (HR-VITON)

- Developed a real-time virtual try-on system that lets users visualize clothing on their photos using the HR-VITON deep learning model.
- Integrated AI-powered virtual fitting with realistic handling of body alignment and occlusion.
- Built a cross-platform Flutter app with smooth performance and state management using GetX.
- Designed and connected a Django backend for authentication, data storage, and model communication.
- Focused on user experience with personalized clothing recommendations and interactive feedback.

Question Answering System — University Project

T5, Transformers, TensorFlow, NLP

- Developed and fine-tuned a T5 transformer model for question answering using the SQuAD dataset.
- Gained practical experience in transfer learning and fine-tuning pre-trained generative models.
- Explored text-to-text modeling, masked language modeling, and dataset structuring (C4).
- Evaluated model performance and optimized fine-tuning parameters for improved answer accuracy.

Newborn Health Monitoring System — Graduation Project

AI, Computer Vision (YOLOv8), Fuzzy Logic, Django, Flutter, Firebase

- Developed an integrated AI-powered neonatal health monitoring system for real-time medical data analysis and early risk detection in premature infants.
- Designed an intelligent pipeline combining computer vision, fuzzy logic, and expert systems to analyze vital signs and detect anomalies in real time.
- Built a robust Django back-end for data management, hospital record integration, and communication with the AI module.
- Developed a Flutter mobile app to deliver instant alerts and live status updates to medical staff using Firebase Cloud Messaging.
- Aimed to support medical teams in preventing emergencies by providing proactive, data-driven alerts.

Karate Kido Automation — University Project

Python, OpenCV, Image Processing, Automation

- Developed a computer vision-based automation system to play a Karate Kid-themed game autonomously, without using machine learning or deep learning models.
- Implemented real-time screen capture and window detection to identify game elements such as characters, wood blocks, lanterns, glass, and score numbers.
- Applied image segmentation and thresholding to extract key visual cues and determine optimal in-game actions.
- Automated player controls using simulated keyboard inputs, enabling the bot to react and perform moves dynamically.
- Focused on performance optimization to ensure real-time decision-making and low-latency response during gameplay.

SKILLS

Programming Languages: Python, JavaScript, Dart, java

Frameworks & Tools: Flutter, Django, NestJS, java spring boot , GetX, Firebase, Tensorflow, OpenCV

Other Skills: UI/UX Design, Full-Stack Integration, Prompt Engineering

EDUCATION

Damascus University | 2020 – 2026

InformaticsTechnology Engineering

- Specialist in Artificial Intelligence

CERTIFICATES

Meta Back-End Developer Professional Certificate 2025

Generative AI with Large Language Models Course 2025

Specialization in Deep learning From Stanford.Ai | 2024

Specialization in Natural Language Processing From Stanford.Ai | 2024

Specialization in TensorFlow: Advanced Techniques From Stanford.Ai | 2024

Flutter Development From Udemy | 2022

principles Of UI / UX Course From Meta 2023
